I think that AI products need to be subject to copyright laws. I say this having recently had an experience with a student who used ChatGPT to write a paper. I did some plagiarism checks on the paper and found that the tool lifted portions of an essay from a paper mill verbatim. I know OpenAI says that is not supposed to happen, but my experience demonstrates that it does. Obviously, individuals at AI developers may not be held accountable for violations, but the corporation/organization could be. Copyright law provides for corporate authorship; why not corporate copyright violation?
