https://techrecipe.co.kr/posts/48321

This blog post is written in Korean.

Stable Diffusion was machine-learned based on 5 billion pieces of data called the LAION-5B dataset, and the data contains numerous authors and photo data.

They shared this model as open source, and many people are currently infringing on copyright by using the program and learning function.

Novel AI took the stable diffusion model above and trained it on a large amount of data from an illegal site called Danbooru. When this company's data model was hacked, it was spread all over the Internet, and to use this leaked data model, abusers created a program called webui.

https://civitai.com/

And currently, webui is inserting a lot of data from extremely trendy artists without their consent. The currently shared civitai shares models that were learned without the consent of numerous authors.

They also share models by subjecting data from specific artists to machine learning without consent.
